1. Requirements Table

Problem Statement 14 – Corporate Mental Wellness & Counseling Platform. FR-001 and NFR-001 were given as sample requirements in the problem statement; the remaining FRs and the second NFR are what I drafted after going through the brief a couple of times and thinking about what an anonymous counseling system genuinely needs in order to hold up.

Req ID	Type	Description	Priority	Acceptance Criteria	Rationale
FR-001	Functional	The system shall assign an anonymized pseudo-ID to every employee account so a counseling session can be booked without the therapist ever seeing the employee's corporate email or employee ID.	High	**Pass:** Therapist's dashboard shows only the pseudo-ID for a session. **Fail:** Employee's corporate email or employee ID shows up anywhere in the booking data.	This is the core privacy guarantee the whole platform is built around.
FR-002	Functional	The system shall let an employee fill out a stress-level assessment and save the result against their profile.	High	**Pass:** Once submitted, the assessment is saved and the employee's stress level is shown back to them. **Fail:** The assessment doesn't save, or no result is shown after submission.	Employees need a way to actually gauge where they stand before deciding to book a session.
FR-003	Functional	The system shall let an employee browse open counseling slots and book one with a licensed therapist of their choice.	High	**Pass:** Employee picks an open slot and gets a confirmation back. **Fail:** System lets two employees book the same slot, or gives no confirmation after a booking.	This is the main thing the app exists to do, so it has to be airtight.
FR-004	Functional	The system shall let a licensed therapist view their upcoming sessions, with each employee shown only by pseudo-ID.	High	**Pass:** Therapist opens their schedule and every entry is tagged by pseudo-ID only. **Fail:** Therapist can't see their schedule, or an entry shows any employer-linked identity detail.	Therapists need visibility into their calendar without that visibility compromising anonymity.
FR-005	Functional	The system shall let an employee cancel or reschedule a booked session as long as it's done more than 4 hours before the session starts.	Medium	**Pass:** A cancel/reschedule request outside the 4-hour window goes through and frees up the slot. **Fail:** A request inside the 4-hour window is accepted anyway, or a valid request outside it gets rejected.	Employees' schedules shift last minute sometimes, but therapists still need a fair cutoff.
NFR-001	Nonfunctional – Performance & Security	The appointment scheduler must handle timezone conversions correctly across the company's different office locations.	High	**Pass:** Appointment times shown to employee and therapist match their respective local timezones under benchmark testing. **Fail:** Any session shows up	A platform used across regions cannot afford to get session times wrong.

Req ID	Type	Description	Priority	Acceptance Criteria	Rationale
				at the wrong local time for either party.	
NFR-002	Nonfunctional – Security	The system shall make sure no query or data export lets the employer link an employee's pseudo-ID back to their real identity or counseling history.	High	**Pass:** An audit of the database confirms there is no join path between pseudo-ID records and HR identity data. **Fail:** Any query or export path exists that can connect a pseudo-ID back to an employee's real identity.	The moment this can be reverse-engineered, the anonymity the platform promises stops meaning anything.

NFR-002 is something I added on my own, mainly because encryption alone doesn't really stop someone from just joining two tables and de-anonymizing an employee that way. Felt like that gap needed to be called out as its own requirement instead of getting folded into NFR-001.

2. Actors

Primary Actors

1. Corporate Employee

- Sets up and uses an anonymous profile
- Takes the stress assessment
- Browses and books counseling sessions
- Tracks their wellness indicators over time
- Can cancel or reschedule a booked session

2. Licensed Therapist

- Views their scheduled sessions
- Only ever sees the employee's pseudo-ID, never their real corporate identity
- Conducts the actual counseling session

Secondary Actor

3. System Administrator

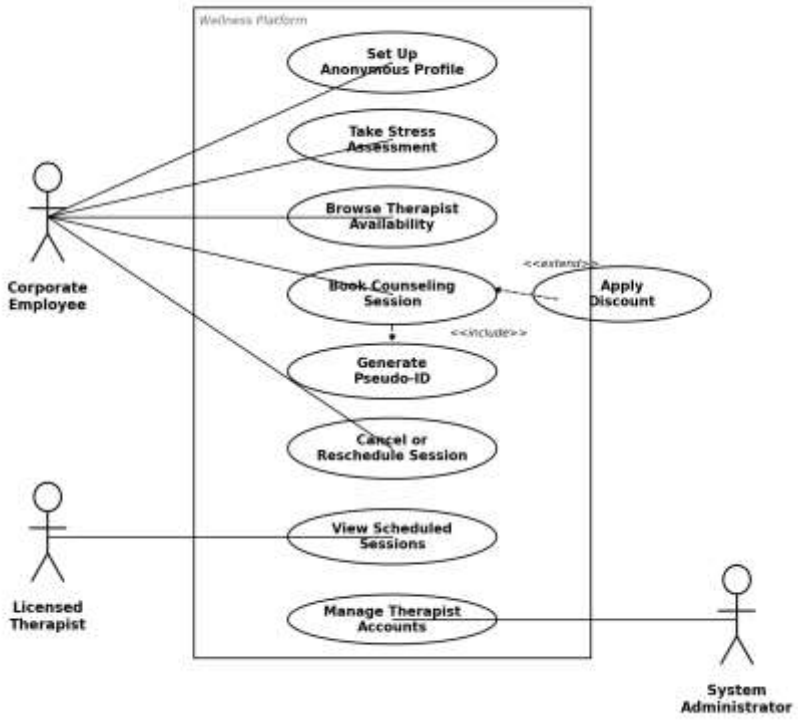

- Manages therapist accounts on the backend
- Doesn't interact with employee-facing bookings or assessments directly

3. Use Cases

ID	Use Case	Actor
UC-01	Set Up Anonymous Profile	Corporate Employee
UC-02	Take Stress Assessment	Corporate Employee
UC-03	Browse Therapist Availability	Corporate Employee
UC-04	Book Counseling Session	Corporate Employee
UC-05	Generate Pseudo-ID	Corporate Employee (via include)
UC-06	Apply Discount	Corporate Employee (via extend)
UC-07	Cancel or Reschedule Session	Corporate Employee
UC-08	View Scheduled Sessions	Licensed Therapist
UC-09	Manage Therapist Accounts	System Administrator

4. UML Use-Case Diagram

Drawn with straight association lines rather than elbowed ones, stick-figure actors, and dashed arrows for the include/extend relationships, following standard UML use-case notation. Book Counseling Session includes Generate Pseudo-ID since every booking needs one, no way around it, and Apply Discount extends Book Counseling Session since it only applies conditionally, for instance when a wellness credit is available.

5. Use-Case Flow

Use Case: Book Counseling Session

Use Case ID: UC-04

Primary Actor: *Corporate Employee*

Preconditions

- Employee has an active profile with a valid pseudo-ID already generated.
- At least one therapist has an open slot available.

Postconditions

Success:

- The session is booked and locked into the therapist's calendar.
- The booking record is tied to the pseudo-ID, not the employee's real identity.
- The therapist can see the session on their schedule, pseudo-ID only.

Failure:

- No session gets booked.
- Employee is told the booking didn't go through and why.

Main Success Scenario

1. Employee opens the platform and is recognized through their pseudo-ID, not their corporate login.
2. Employee selects "Browse Therapist Availability."
3. System lists therapists with open slots, filterable by specialization.
4. Employee picks a slot and selects *Book Counseling Session*.
5. System runs the *Generate Pseudo-ID* step if one doesn't already exist for this booking context (<<include>>).
6. System double-checks that the slot is still free at the moment of booking.
7. System locks the slot and records the booking against the pseudo-ID.
8. Employee gets a confirmation with the session time and joining details.
9. Therapist can now see the session on their schedule, identified only by the pseudo-ID.
10. Use case ends successfully.

Alternate Flow – Slot Taken by Someone Else

(branches off step 6 above)

- System finds that another employee grabbed the same slot a moment earlier.
- Employee is told the slot is no longer available.
- System refreshes the list and shows other open slots.
- Employee picks a different slot and the flow resumes from step 6.
