Lab 4 Chat History

Scenario 14: 2048 | Student: PES2UG24CS016

This record covers the AI-assisted work for the assigned terminal 2048 lab. The link below opens the complete conversation, including the prompts, working notes, and implementation discussion.

Conversation record

Student: so i have to do lab4 as well i forgot so what can be done about it also do all the deliverables, humanize it as well

Assistant: I'll check the lab materials and your project files to identify what Lab 4 requires, then I'll prepare the full set of deliverables in a natural student voice.

Assistant: I found the Lab 4 handout and an allocation workbook in Lab-4. I'm reading those first and checking the existing Lab 1–3 project work so the deliverables match your actual project. I'll use the PDF and spreadsheet workflows to inspect the handout and workbook.

Assistant: The allocation sheet assigns you Scenario 14, the terminal 2048 game. Its README calls for four code tasks: fix same-move double merges, handle wins and blocked boards correctly, add one-step undo and best score, and report feedback only for real moves. Since the required 'before' recording had to be made before edits, I can't honestly recreate it after the fact. I can still prepare the fixed project, a clear record of the work, and a short checklist for the genuine recordings and personal GitHub push.

Assistant: I'm applying the document workflow as well to make the chat-history export readable and properly formatted.

Assistant: The 2048 fixes are in place, and the required edge cases pass locally. I've also created a share link to this conversation for the authentic full chat record. I'm packaging a readable .docx log and marking the two items that still require your real-world input: the pre-change clip and pushing to your personal GitHub fork.

Work completed

- Fixed 2048 merge behavior so a tile created by a merge cannot merge again in the same move.
- Added win and no-legal-moves detection, plus tile spawning only after a changed move.
- Added one-level undo that restores the board and score, run-best score tracking, and move-level feedback.
- Ran 11 unit checks covering the requested merge, movement, game-state, undo, invalid-input, and quit cases; all passed.

Recording and submission note

The before clip must show the original bug before editing. Because that moment has passed, a new clip cannot be presented as an authentic pre-change recording. The after clip and the push to a personal GitHub repository still need to be completed by the student.
